Advantages: Pallet sheets

- Simple, stable packaging for heavy industry.
- Parts fit easily onto pallet sheet.
- May be wrapped without the use of a pallet frame.
- Design protects vulnerable items with specific parts that require shock-absorbing protection.

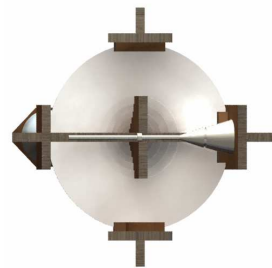

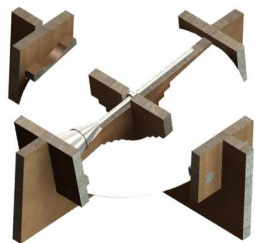

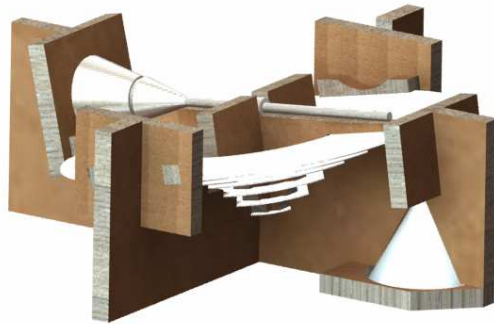

- Cradles are the ideal solution for special items such as large rolls, etc. In most cases, cradles do not entail additional tooling costs.

Advantages: Slotted cross designs

- Saves space in the warehouse.
- Still requires assembly, but allows for quick packing.
- Minimal amount of packaging required to securely box complex parts.

Advantages: Top and bottom designs

- Complete packaging.
- Eliminates the need for separate outer packaging such as boxes.
- Same design may be used for several different parts:
 - Same product number for multiple parts;
 - Larger production runs for same packaging design means a better price.
- Client-specific designs.

Advantages: Compartmentalised designs

- Flexible solution for items that do not require shock-absorbing protection and immobilisation.
- Can also function as spacer modules.
- May be used to create different-sized compartments in boxes depending on number of dividers used.
- Ideal for both small boxes and large pallet boxes.
